1. 1 / 1 point

For linear regression, the model is $f_{w,b}(x) = wx + b$.

Which of the following are the inputs, or features, that are fed into the model and with which the model is expected to make a prediction?

- w and b.
- m
- (x, y)
- x

Correct
The x, the input features, are fed into the model to generate a prediction $f_{w,b}(x)$

2. For linear regression, if you find parameters w and b so that $J(w, b)$ is very close to zero, what can you conclude? 1 / 1 point

- This is never possible -- there must be a bug in the code.
- The selected values of the parameters w and b cause the algorithm to fit the training set really well.
- The selected values of the parameters w and b cause the algorithm to fit the training set really poorly.

Correct
When the cost is small, this means that the model fits the training set well.
